**Dietary, Environmental, and Societal Implications of Ancient Maya Animal Use in the Petexbatún: A Zooarchaeological Perspective on the Collapse ... Institute of Mesoamerican Archaeology Series)** Kitty F. Emery

The Classic Maya "collapse" has been attributed to environmental destruction, declining dietary health, and social changes such as increased warfare or changing economies. This study explores these models using ancient animal remains recovered from the Petexbatún archaeological sites.

The species found in the Petexbatún faunal collections are compared as proxy evidence for the ancient habitats and landscapes that would have existed around the sites. They reveal that the ancient landscape of the Petexbatún region was not significantly deforested or otherwise destroyed at the end of the Classic period. Bone chemistry of archaeological deer bones confirms that there was no significant expanse of agricultural fields at the expense of forested lands over the occupation of the region. The animal remains are next used to test a related model for the Maya collapse: dietary failure. Comparisons of the remains of food species from residential deposits indicate that the Petexbatún Maya were in no danger of famine or protein deficiency--hey neither overhunted their animal resources nor destroyed their habitats to the extent that dietary species were no longer available.

An intriguing deposit of worked animal bone from the capital city of Dos Pilas offers a clue to the puzzle. Here, following the abandonment of the site by the ruling elite, a family group manufactured quantities of utilitarian bone artifacts, probably for trade with other scattered communities in the region. This finding suggests the importance of re-evaluating socioeconomic causality for this transitional period in the Petexbatún and elsewhere in the southern Maya lowlands.
